Thank You

Daviess County plays an important role in Kentucky by providing excellent data on variety trials and demonstration plots. The cooperation of area producers and their commitment to research and demonstration work provides reliable information to producers across Kentucky.

Special thanks goes to the cooperators involved in the corn, soybean, and tobacco variety trials and demonstration plots. Their contribution of time and resources are invaluable to the area.

Thanks to Troy Muse, Adult Vocational Agriculture Instructor, for his help in weighing plots and for his collection of data for this report.

A grateful thanks goes to the seed companies and their representatives for providing seed for these plots and the Extension Office Staff Assistants for their outstanding effort in preparing this booklet.

DAVIESS COUNTY TEST PLOTS

PURPOSE: To provide reliable data on the yield potential of the brands that are best suited for this area. Through these plots, we attempt to provide educational information in an unbiased and scientific form to the producers of the area.

PLOT LOCATION: Variety trials were implemented in all areas of the county. Plots were located to the west, south, and east of Owensboro, representing various soil types, planting dates, and rainfall amounts.

COUNTY-WIDE PLOT FORMAT: To increase the comparison of a variety from one plot to another, we developed a plot design that required each plot to follow the same plan. In the plan, we required that the check is placed after every three varieties so that we could make a reliable adjusted yield calculation. An adjusted yield calculation was figured using the surrounding check yields as a basis. Also, to allow the check variety to be evaluated, the third check in each plot was calculated and adjusted on an individual basis and the results enclosed in parenthesis.

To allow producers to gauge the dry-down ability of the hybrids, we have included the maturity days of each one.

2021 Crop Year in Review

Every farming year begins with winter maintenance, meetings, animal care, and grain hauling; except during a pandemic. COVID-19 continued in 2021 keeping schools, churches, and agricultural meetings contained to a computer camera and microphone last winter. Internet communication certainly provided a connection for information during COVID-19 and taught us to connect more efficiently, but I haven't met a single person who said they preferred video conferencing over in-person. Despite the inconveniences of COVID-19, farming and living continued through the winter with vaccinations becoming available to the general public in February. Schools, restaurants, and churches reopened with reduced seating by early spring and people slowly and cautiously became accustomed to public encounters again. One lesson learned from 2020 was that essential business keeps going and farming in Daviess County would continue with a very successful and prosperous 2021.

In general, the 2020/2021 winter was dry with above normal temperatures. The only measurable precipitation fell as rain on January 21. Most of January was focused on grain and tobacco delivery, litter application, and machinery repairs and maintenance. One of the most surreal experiences of the pandemic in 2021 was the disruption of supply chain distribution first experienced with food processing in 2020. The disruption continued in shipping and manufacturing. New machinery, some supplies, and replacement parts were severely delayed or completely unavailable during all of 2021 as the effects of reduced work pace and shipping from 2020 began to appear when shelves did not refill when items were removed and sold.

The weather missed in January hit in February. The first couple of weeks were clear but a deep freeze and snow began on Valentine's Day and continued for the week. Three to five inches of snow was reported across the county, combined with very cold temperatures. The fourth week warmed up with a large rain late in the month. Gravel roads and animal feeding areas that were softened by the recent freeze/thaw cycle turned to mud in the first week of March.

March brings warmer, longer days and is always the period to finalize plans, machinery, inventories, and get started. Anhydrous Ammonia application began early in the month as well as tobacco greenhouse preparation. The exit of multiple large acreage burley tobacco farms reduced the planted tobacco acreage in Daviess County to its lowest ever. Many farms remained in production in 2021. It will be up to the tobacco leaf buyers to keep tobacco profitable if they wish to continue purchasing tobacco grown in this area in the future. A large rain in the third week of May dissipated quickly as warm, windy conditions continued, drying and warming soil providing optimum conditions for farms seeking to plant ultra-early soybeans.

April began hot and dry, perfect conditions for soybean and corn planting, with more than half the county corn crop and thousands of soybean acres getting planted in the first two weeks. The third week dropped lower in temperatures with light frost and snowfall on the 21st. Concern regarding the emerging corn and soybeans was minimal based on our experience of the May 2020 freeze events. Temperatures remained cooler late in the month with wet soils that slowed corn and soybean emergence and provided optimum conditions for slugs to cause major feeding damage to no-till soybeans.

May was beautiful. Hot and dry soil conditions through the latter half of the month were ideal for decreasing slug activity and achieving rapid crop growth and herbicide activity on the post-emergence herbicide applications. Weather conditions provided an ideal opportunity for harvesting hay, tobacco growth, and finishing soybean planting. Despite the end of April being cool and wet, the crop was off to an ideal beginning. After several wet springs, it was so nice to plant through fields with no worry of wet areas that would have to wait for further drying.

June continued the dry conditions of May. Clouds and rain forecasts in the second week delayed herbicide application with rain appearing imminent on the horizon but it never came. Wheat harvest began in the fourth week with cooler temperatures and low humidity. The wheat crop was excellent, a result of a dry winter and May providing optimum growing conditions. By the end of June, many corn and soybean fields dried out as rapid growth and no rain dried topsoil moisture.

The concern of corn tasseling in hot, dry soil conditions was relieved as much of Daviess County received a slow and steady rain of up to two inches on July 1. The rain, following an extended hot period, could not have been better for the corn but initiated a week of one major concern for the soybean crop – dicamba herbicide injury. Multiple factors aligned to cause widespread dicamba injury in 2020. First, at least two-thirds of the soybean acres were Enlist, which is not tolerant to dicamba. Second, two years of dicamba use with no reported damage gave private and commercial applicators a false sense of security. And the third reason, I am convinced the amount of land applied during the hot, low humidity period loaded the atmosphere with dicamba vapor which rained out on July 1. Another two inches of rain fell, slowing on the 10th, pushing the early April corn to optimum potential and providing later corn again with ideal moisture for pollination.

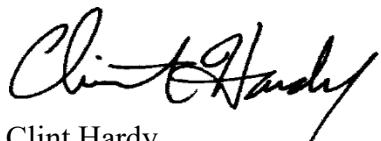

August was hot and dry with lots of sunshine. The only measurable rain fell on the 9th with most of the county reporting .5-.8 inches. Extreme heat dissipated later in the month but sunshine and heat caused early planted soybeans to begin coloring on slopes and thinner soils. Tobacco harvest was underway and most indicated harvesting the best tobacco they had grown in years. Limited but well-timed rain in July was perfect for a crop that is not tolerant of excessive moisture after topping.

Labor day is the first Monday in September each year and the official beginning of harvest in this area. The 2020 crop was exceptional, so most were prepared for a crop of less. Despite corn getting a nice start and timely rain at pollination, a dry June and August were concerning and most producers expected final yield to be affected by it. Indeed, it was not! Daviess and all of Kentucky experienced record-high yields of corn and soybeans. It is certainly a nod to seed genetic technology paired with a great start and perfectly timed rain. In addition to yield, prices for wheat, corn, and soybeans were well above the 5-year average, allowing producers the opportunity to market grain well above the cost of production throughout the year and even at harvest when the basis usually declines.

October continued with ideal, warm, dry harvest weather. An occasional shower slowed harvest only temporarily as no significant rain fell until the 25th. The first week of November

was dry but colder, bringing the first killing freezes of the year. A warm-up in the second week provided a pleasant opportunity to clean harvest equipment.

Planning is already underway for 2022. As of today, fertilizer prices are two and a half times higher than spring of 2021 and we're told glyphosate and glufosinate will be in short supply, possibly not even available. COVID-19 continues with reported numbers declining once again, but time will decide when it is over. All we know is that Daviess County crop and animal agriculture had an extremely successful year. For that, we are blessed and thankful.
